UML diagram

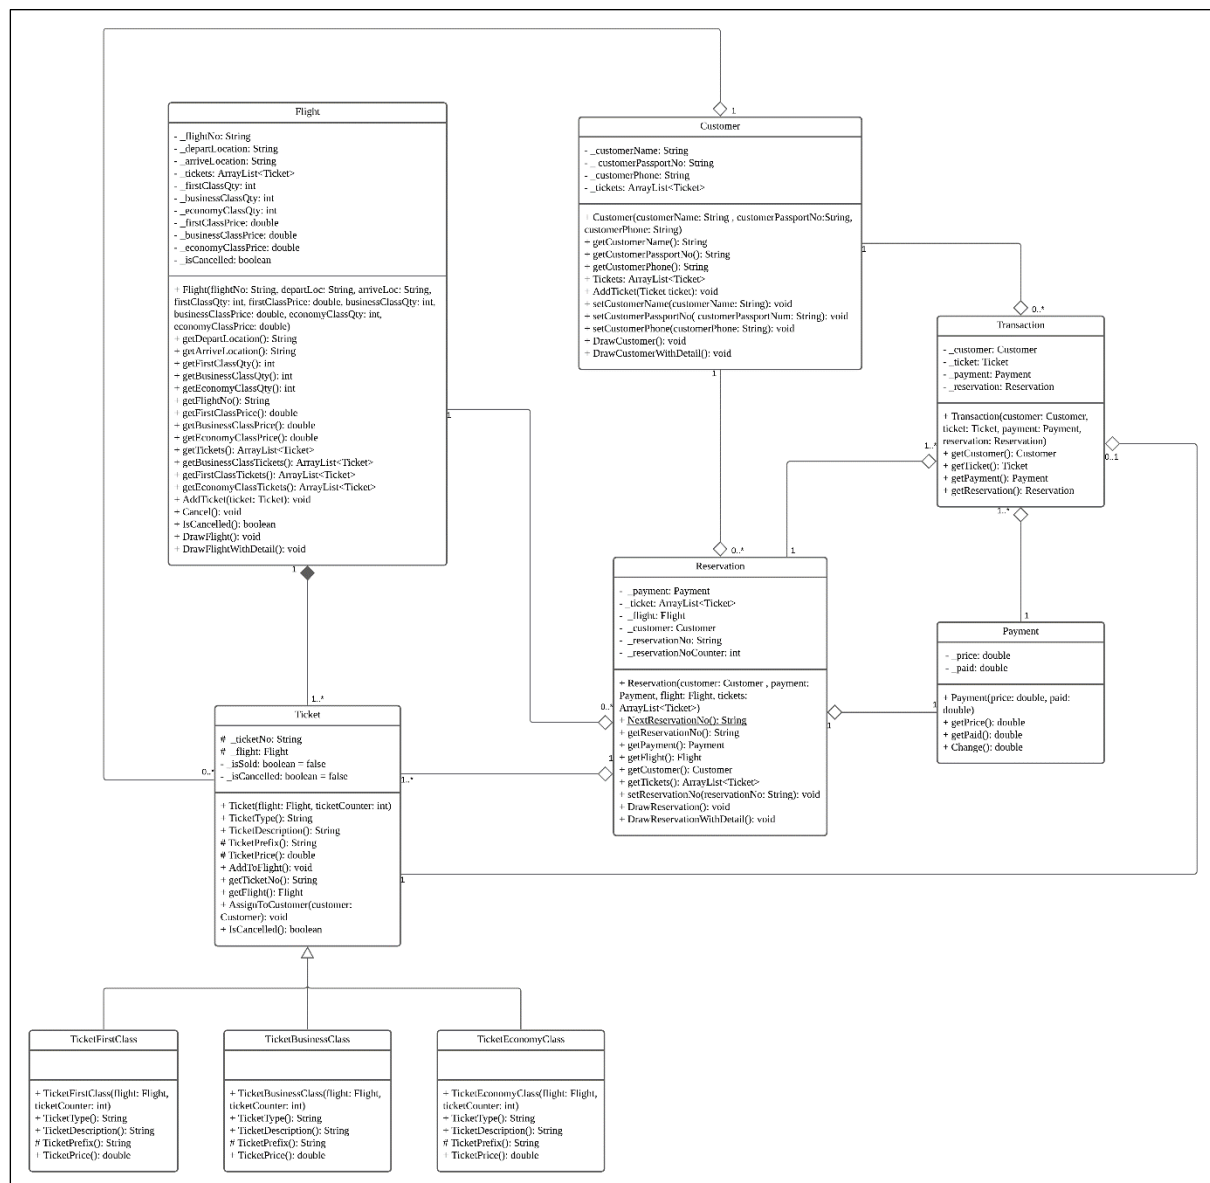

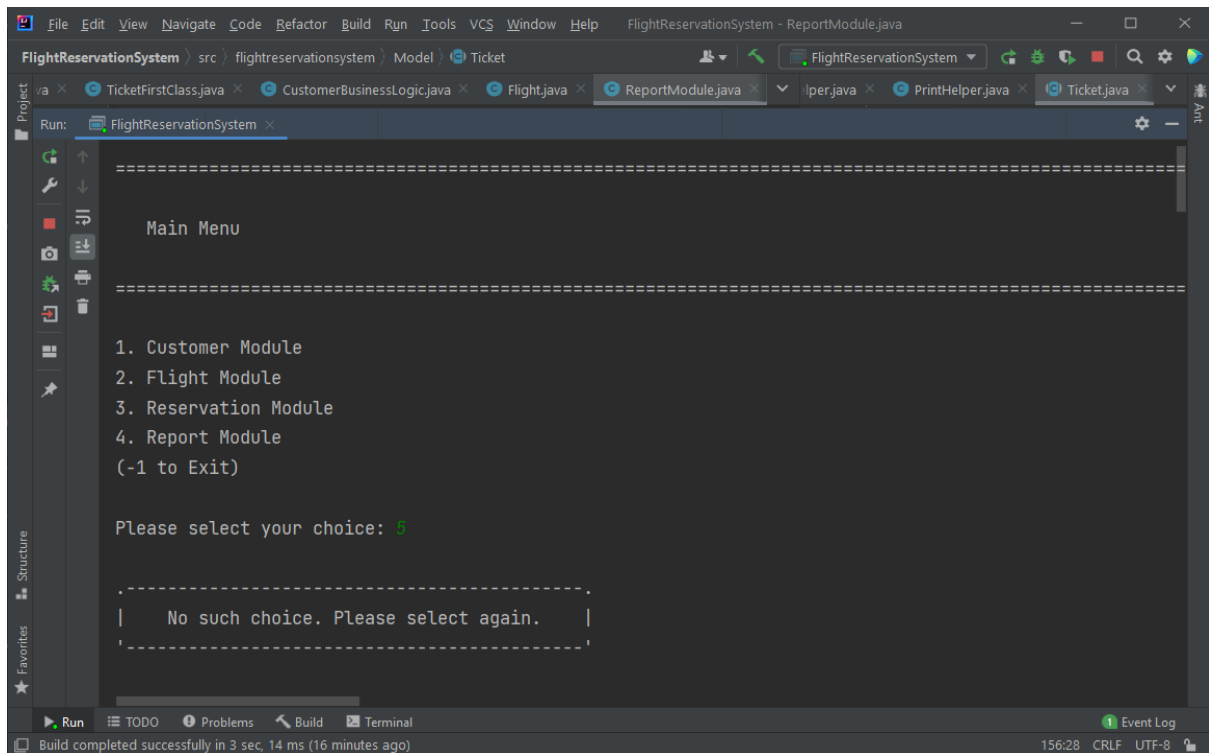

Figure 1 shows UML diagram of flight reservation system.

Description of Ideas

- ✓ This system user is the **staff** that help customers to reserve and purchase tickets.
- ✓ Our system allows the receptionists to add, view, and delete flight details.
- ✓ The receptionists can add, view, update and delete customer details.
- ✓ A flight's tickets have different classes like first class, business class, and economy class.
- ✓ Each class of tickets has a different price, different style of ticket number.
- ✓ A customer can reserve and purchase many flight tickets at once.
- ✓ The customer must make the payment after the reservation of flight tickets.
- ✓ The customer is not allowed to cancel the reservation and payment after paying.
- ✓ There is a ticket status showing whether the tickets of a flight are still available or have been sold.
- ✓ If the flight is deleted, the bought tickets status will change to “cancelled”.

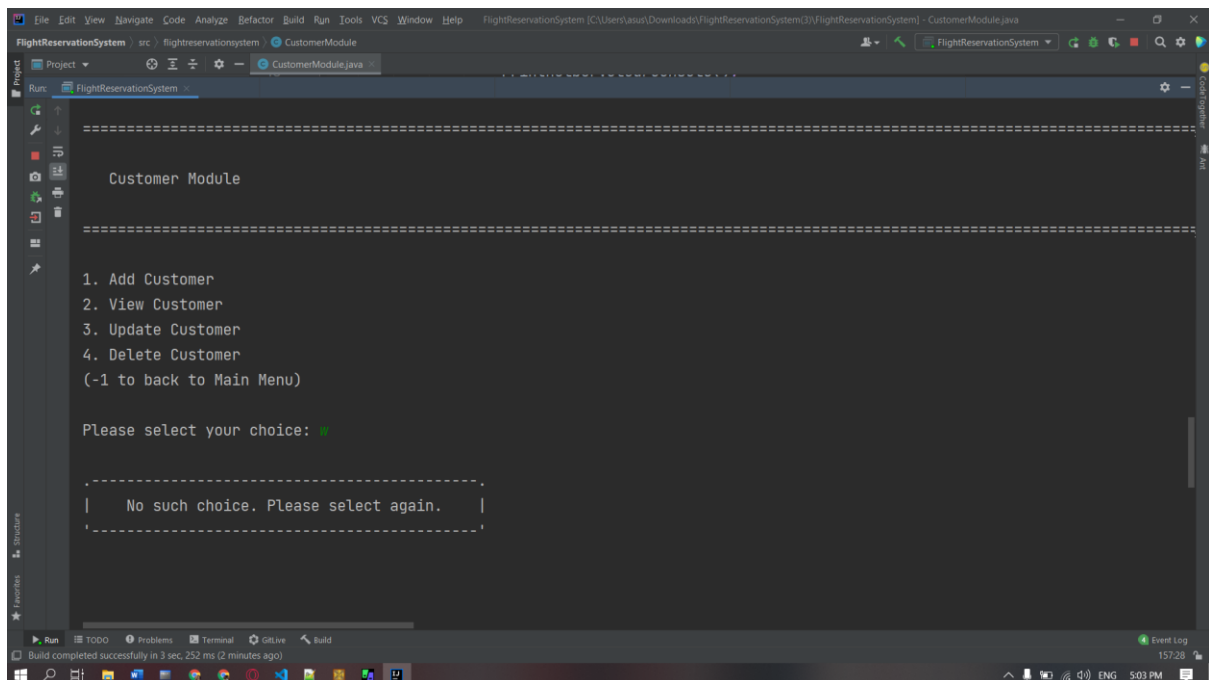

Figure 3: shows the main menu validation 2

Customer Module

The screenshot shows an IDE window titled "FlightReservationSystem" with a file named "CustomerModule.java" open. The code in the editor displays a menu for the "Customer Module". The menu is enclosed in a dashed box and lists the following options: "1. Add Customer", "2. View Customer", "3. Update Customer", "4. Delete Customer", and "(-1 to back to Main Menu)". Below the menu, there is a prompt "Please select your choice:" followed by a green cursor. A dashed box below the prompt contains the text "No such choice. Please select again." The IDE's status bar at the bottom indicates "Build completed successfully in 3 sec, 252 ms (a minute ago)".

Figure 4: customer menu with actions can be made

This screenshot is identical to Figure 4, showing the same IDE window and code for the "Customer Module" menu. It displays the menu options, the selection prompt, and the error message for an invalid choice. The status bar at the bottom shows "Build completed successfully in 3 sec, 252 ms (2 minutes ago)".

Figure 5: customer menu with actions can be made

The user can choose to add, view, update and delete customer details, if the user has entered a choice that is not included in the menu, they will be prompted and asked to choose again.

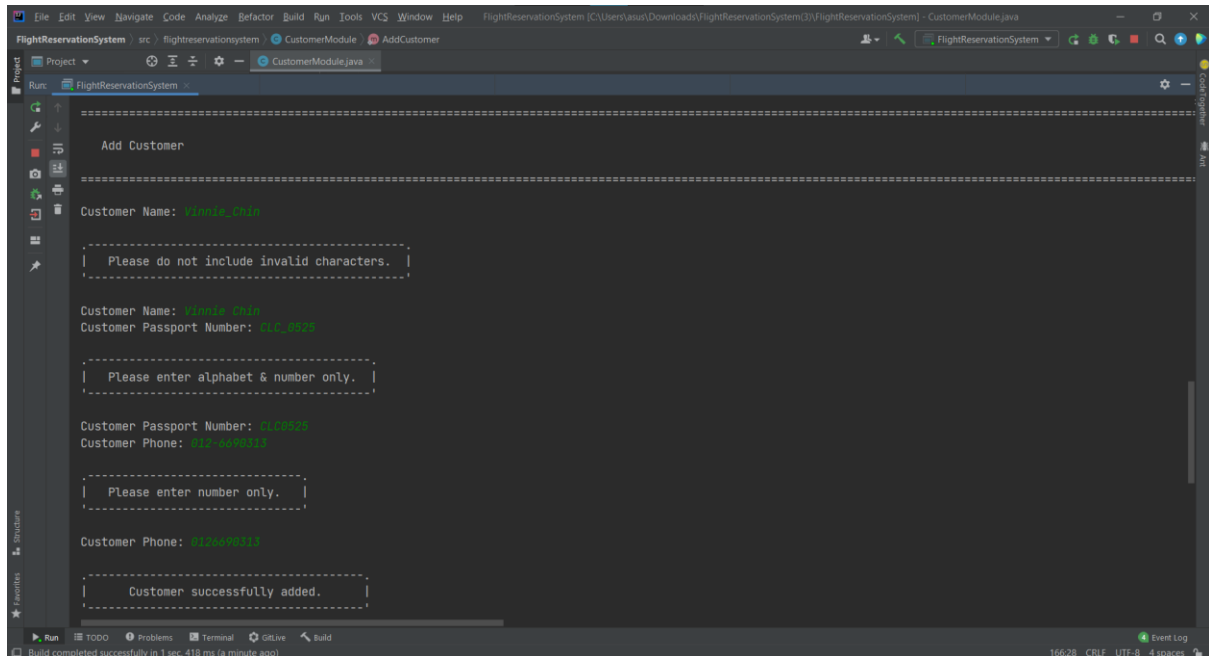

Figure 6: shows add customer details

There are validation checks for every field of customer details. For customer names, it is not allowed to have invalid characters. Only alphabet and numbers are allowed in passport numbers, and for phone numbers everything is not allowed except digit.

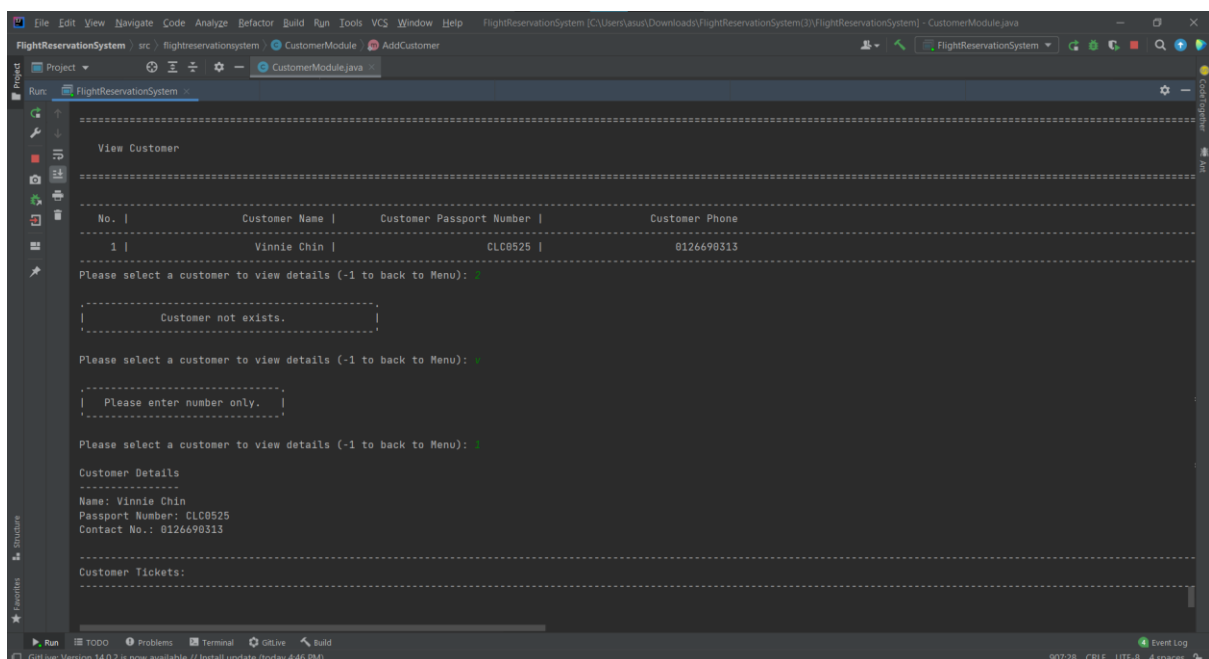

Figure 6: shows view customer details

When the user wants to view customer details, he or she can select the customer with a number that is listed in the list to view. If the user selects the user that is not in the list, the user will be prompted that the customer selected does not exist. Also, when the user has entered the alphabet there will be a prompt telling the user to enter a number (number in the customer list) only. Customer tickets are not showing anything yet as the customer didn't make any flight reservation yet.

```

=====
Update Customer
=====
Customer Name: VinnieChinLohXin
-----
| Please do not include invalid characters. |
-----
Customer Name: Vinnie Chin Loh Xin
Customer Passport Number: LCVC0719
-----
| Please enter alphabet & number only. |
-----
Customer Passport Number: LCVC0719
Customer Phone: 0123456789
-----
| Please enter number only. |
-----
Customer Phone: 0123456789
-----
| Customer successfully updated. |
=====

```

Figure 7: shows update customer details

When the user wants to update customer details, he or she can select the customer with a number that is listed in the list and make changes to the customer details. The validation checking on this part is similar to the validation checking of the add customer section.

```

=====
View Customer
=====

```

Figure 9: shows customer details with tickets reserved after making flight reservation

After the user finishes the booking payment of flight reservation for the customer, the tickets purchased will be shown in the customer tickets under customer details. As you can see from the screenshot above, there are few ticket bookings for two different flights showing each of the ticket details recorded in the customer record.

```

Please select a customer to delete (-1 to back to Menu): vinnie

-----
| Please enter number only. |
-----

Please select a customer to delete (-1 to back to Menu): 1

-----
| Customer successfully deleted. |
-----
```

Figure 11: shows delete customer

The user is able to delete the customer record at the delete customer section. From there, the user is required to select the customer number to delete their record. There will be validation checking to make sure that the number entered for the customer record exists and also the value entered is numerical. After choosing the right customer to delete, the system will prompt a success message showing that the customer record has been successfully deleted.

```
=====
View Customer

```

Figure 14: Flight menu validation 2

The flight menu has the validation restrict the not in listed character (1, 2, 3, -1).

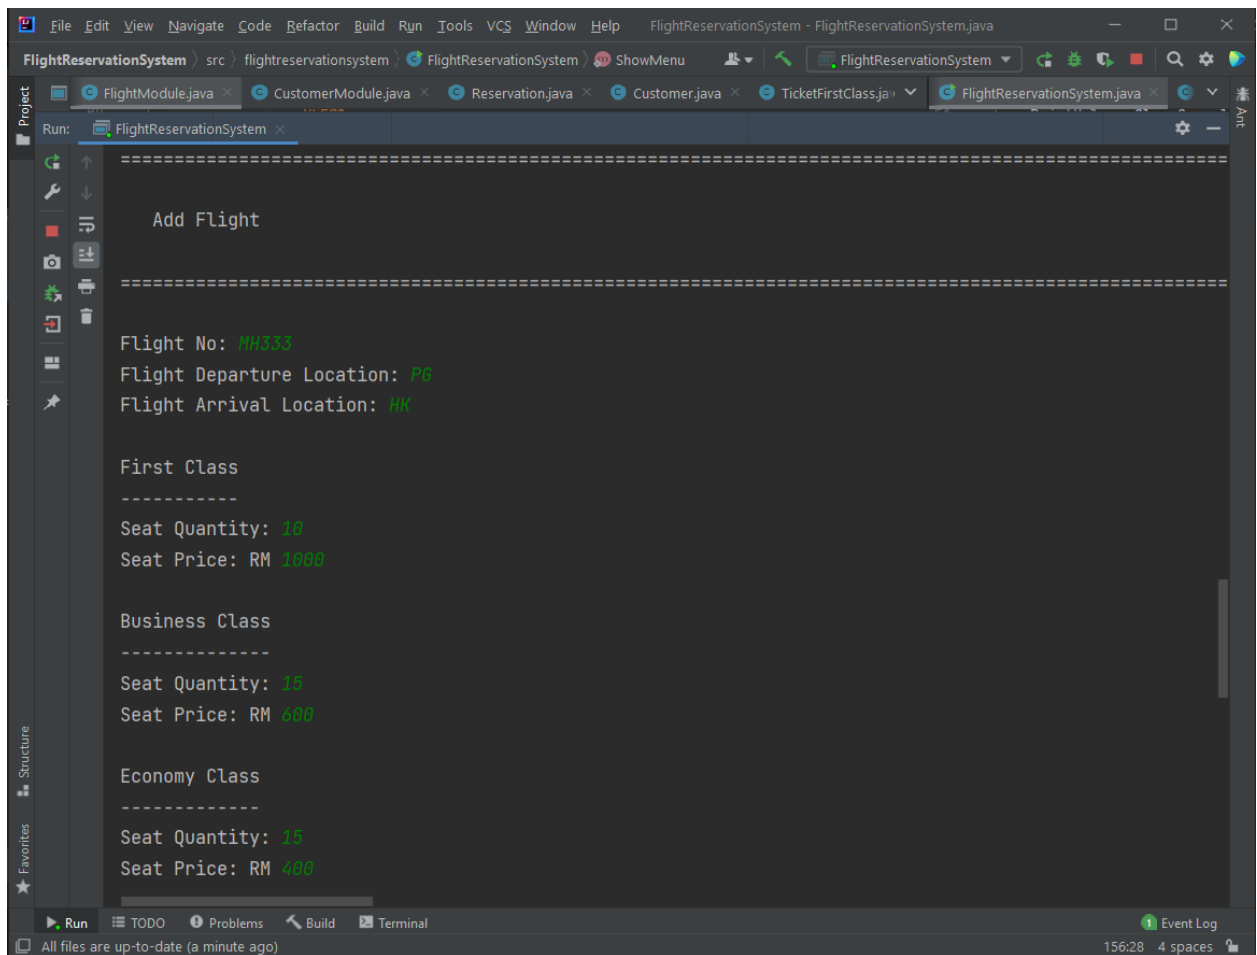

Figure 15: Add Flight 1

The screenshot shows an IDE window titled 'FlightReservationSystem - FlightReservationSystem.java'. The 'Run' tab is active, displaying the output of the 'Add Flight' program. The output is as follows:

```
=====
Add Flight
=====
Flight No: 80E737
Flight Departure Location: SFO
Flight Arrival Location: ATL

First Class
-----
Seat Quantity: 10
Seat Price: RM 30000

Business Class
-----
Seat Quantity: 10
Seat Price: RM 10000

Economy Class
-----
Seat Quantity: 10
Seat Price: RM 5000
```

The IDE interface includes a menu bar (File, Edit, View, Navigate, Code, Refactor, Build, Run, Tools, VCS, Window, Help), a toolbar, and a sidebar with 'Project', 'Run', 'Structure', and 'Favorites' views. The status bar at the bottom indicates 'All files are up-to-date (4 minutes ago)' and '254:28 4 spaces'.

Figure 16: Add Flight 2

The user needs to key in the flight number, departure and arrival location. As every flight does have first class, business class, and economy class type, The user needs to key in the quantity and price of each class type.

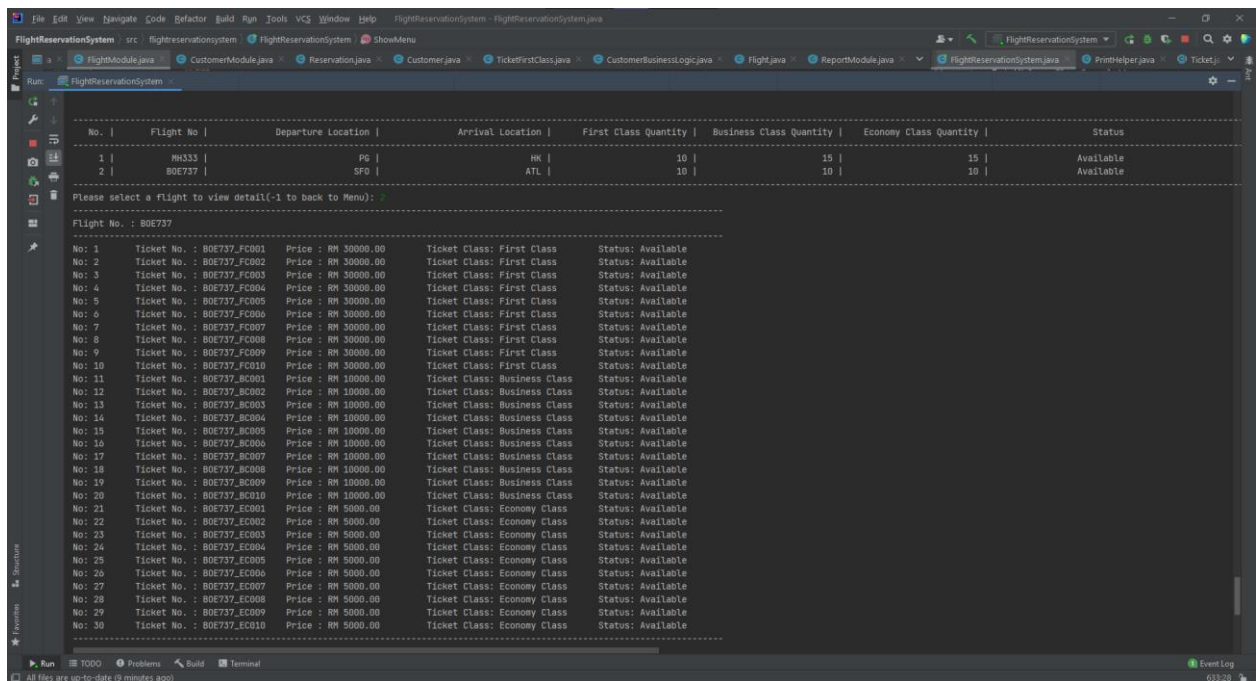

Figure 17: View flight and flight details

When the user enters view flight, the user can choose the number to view the flight detail(tickets).

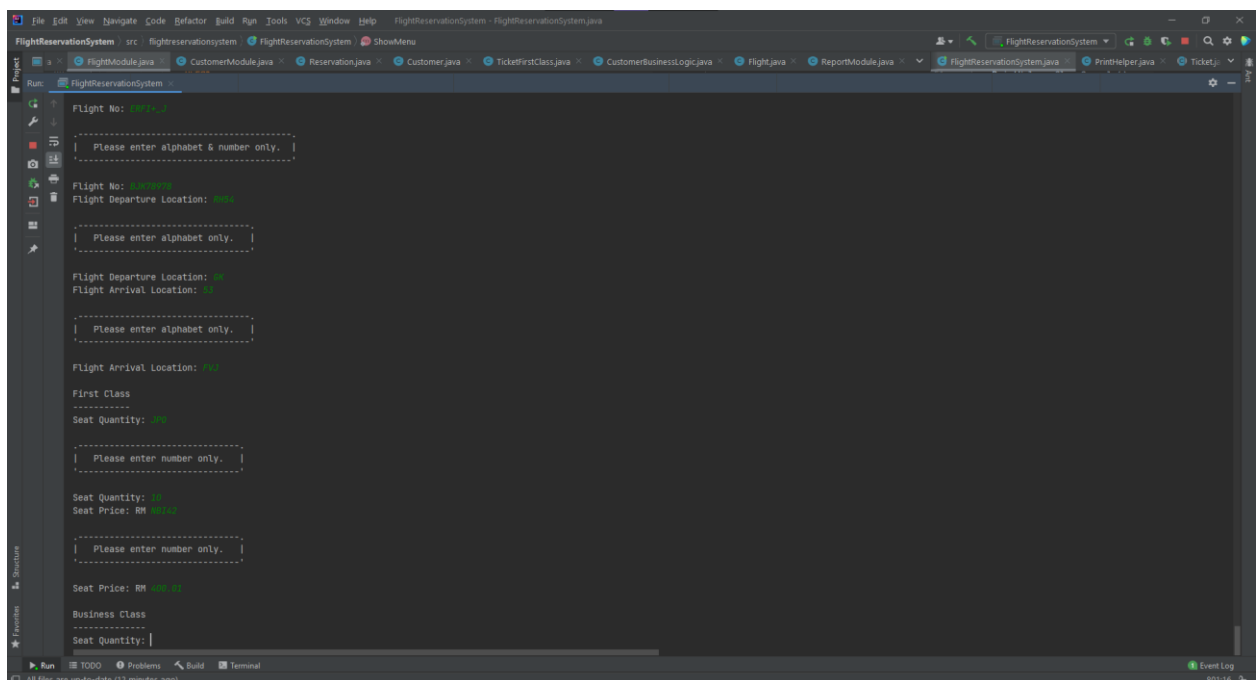

Figure 18: Flight validation

Here is the add flight validation. The flight number can only contain the alphabet and number, no symbol allowed. The location only allows the alphabet. The seat and price are not allowed for any alphabet and symbol.

```

Figure 23: Reservation module validation for symbol

After the user enters “3” in the main menu, the reservation module menu will be displayed. Then users can choose to add reservation or view reservation by entering “1” for add and “2” for view. “-1” is for the user to go back to the main menu. If the user enters an

alphabet, symbol, or another number other than “1”, “2” or “-1”, a validation message will be displayed to let the user know there is no such choice.

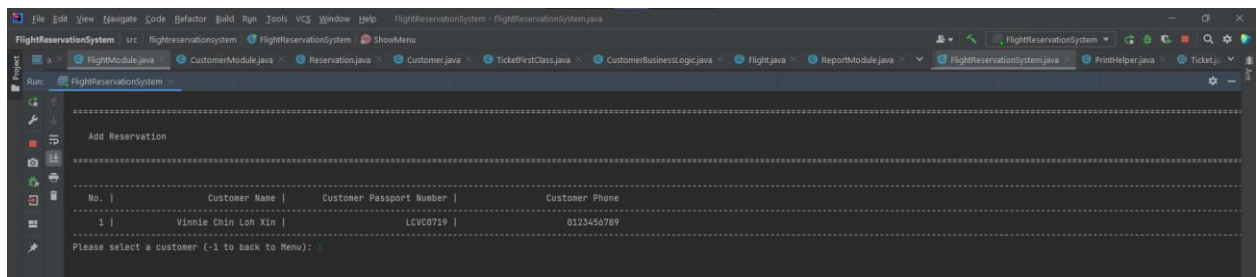

Figure 24: Add reservation

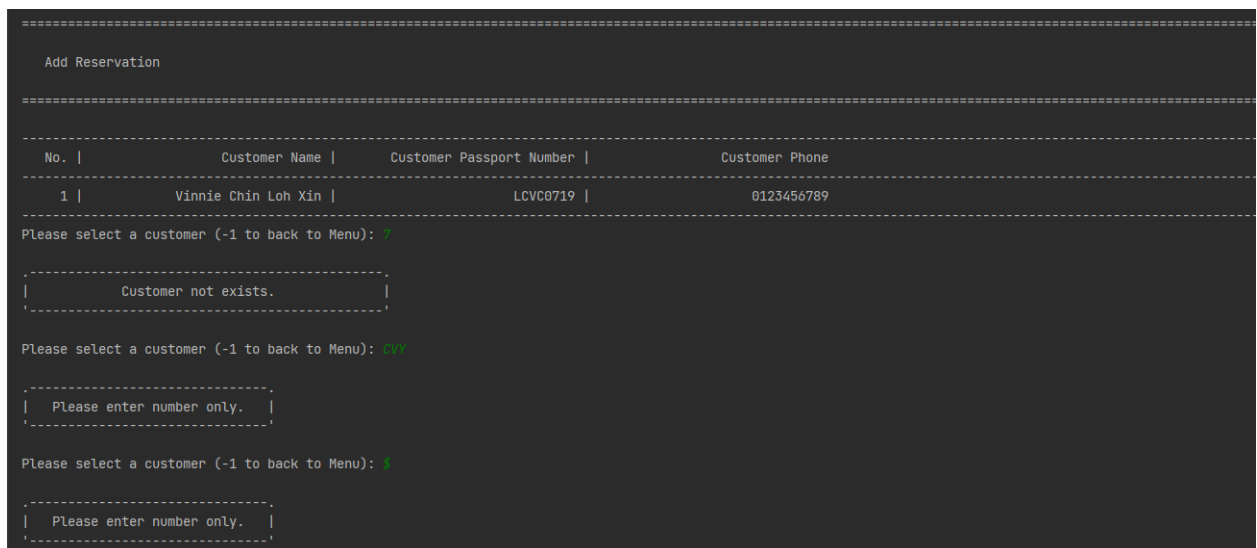

Figure 25: Validation for select customer

After the user enters “1” to add the reservation, the customer list will be displayed to let the user select to add the reservation. If a user enters a customer that does not exist, a validation message “Customer not exists” will be displayed. Other than this, if the user enters an alphabet or symbol, a validation message “Please enter number only” will be displayed.

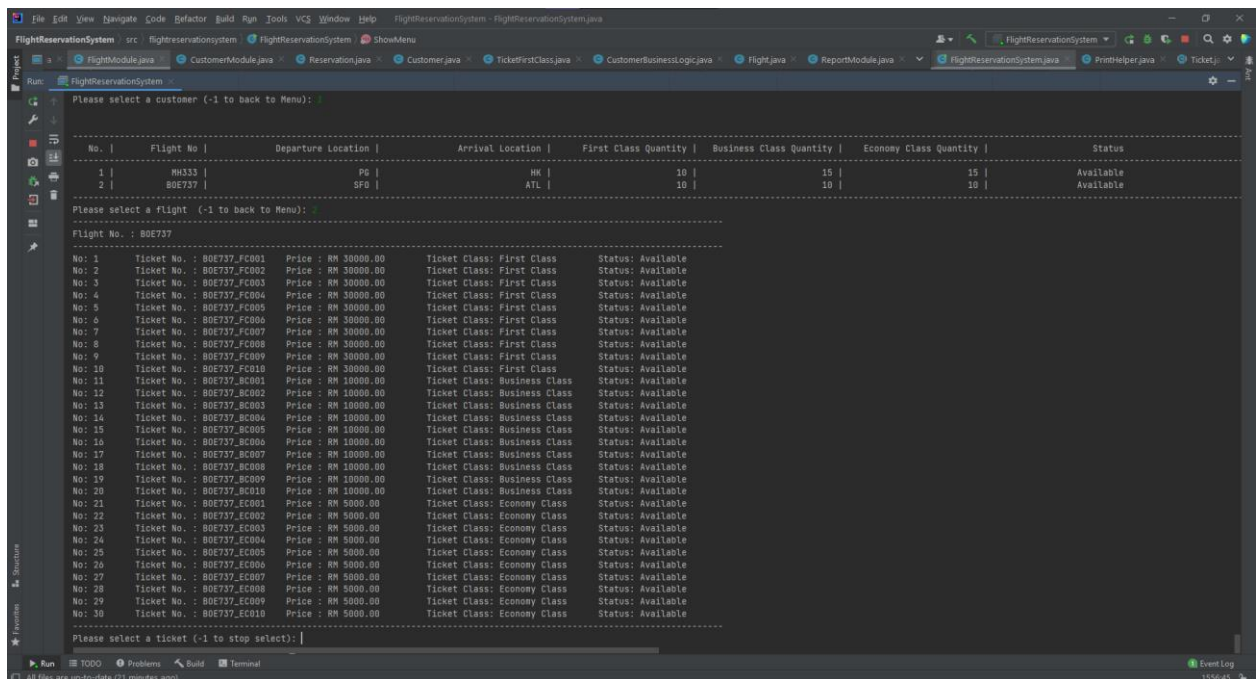

Figure 26: Reservation module (choose the flight & show ticket)

After selecting the customer, the user needs to select the flight. For this select flight, it will also have the same validation with the selected customer. If a user enters a flight that does not exist, a validation message “Flight not exists” will be displayed. Other than this, if a user enters an alphabet or symbol, a validation message “Please enter number only” will be displayed. When the user selects a flight and enters the correct input, all tickets for that flight will be shown.

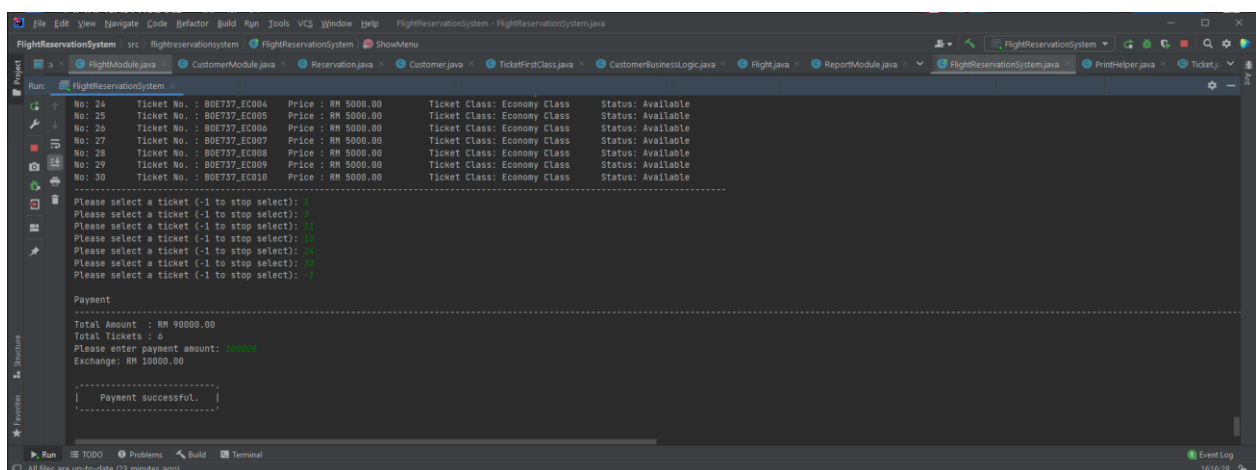

Figure 27 : Reservation module (choose ticket & make payment)

Furthermore, the user will need to select the tickets they want. After finishing selecting the tickets, enter “-1” to stop selecting and proceed to payment. Payment will show the amount that the user needs to pay, the user will need to enter the payment amount. If the amount paid by the user exceeds the amount that is provided, the exchange will be shown to the user. A message “Payment successful” will be shown to the user.

Figure 45: Report module validation for symbol

When the user enters the report module, the report menu will be displayed. In the report module, it will be validated, in order to prevent the user from entering the invalid number, because there are only digits from 1 to 5. Therefore, when the user enters an invalid number, it will pop out the invalid message to let the user know they are entering the invalid number. In

this module, the user cannot press the alphabet, symbol or other digits to continue the process to another page.

Figure 46: Validation in each of the report

In all the reports, it also has validation, and their validation the same. But in the screenshot, we only show the validation of a report. In this module, the user cannot enter the alphabet, symbol or other digits to continue. When the user enters the invalid number, then it will display an invalid message to let the user know they are entering the invalid number.
